**Date:** March 30, 2024

**Subject:** Incident Report on Self-Experimentation of Researchers

---

## Summary:

On March 28th, 2024, three scientists took experimental pills unprompted and in unison. They previously showed no interest in testing the substance and recordings show no prior intent to take the pills. No other researchers were present at this time. The researchers were all positioned in an equilateral triangle around a monitor, placing their left hand on it while taking the pills with their right hand. Instead of taking several minutes it took seconds for them to pass out, though we're unsure why. The leading theory is they added more of [REDACTED] to it than the regular dose, though unless they followed the lengthy procedure to make more that is impossible.

---

## Incident Details:

On March 28th, 2024, a workplace incident occurred involving three researchers—Dr. Alan [REDACTED], Dr. Maria [REDACTED], and Dr. Susan [REDACTED]—who simultaneously ingested experimental pills containing [REDACTED]. The researchers showed no previous intent to ingest the pills.

At approximately 22:30, surveillance footage captured the researchers standing in an equilateral triangle around a monitor. Each placed their left hand on the screen while using their right hand to consume the pills. This is peculiar because there was no chance for them to discuss a plan previously. Additionally the video captured them all moving in an unnaturally precise way.

The researchers lost consciousness within seconds, as opposed to the 5-10 minutes with previous subjects. Preliminary medical evaluations revealed no anomalies, we will examine the bodies further when we have the opportunity.

A leading theory posits that the pills ingested contained a higher concentration of [REDACTED] than standard doses. This would necessitate a

lengthy preparation process involving precise measurements and procedures, which would be impossible without any of the other staff noticing it.

Additionally, the formation around the monitor and the synchronized action may be a sign of a larger issue. The monitor itself briefly showed an image of some red circle with a line through it diagonally, though it's difficult to describe because of the position of the camera and the low quality of the video.

This incident shows we may need funding for psychological evaluations of personnel involved in the [REDACTED] project to avoid losing more personnel.

---

**Final Remarks:**

While the loss of Dr. Alan [REDACTED], Dr. Maria [REDACTED], and Dr. Susan [REDACTED] is regrettable, their contributions provide invaluable data. Continued exploration of [REDACTED] is essential to unlock its full potential and understand the implications of its use.

**Prepared by:**

Dr. Liam [REDACTED]  
Lead Research Scientist  
IntegraLab Inc.

After further examination of the researchers I discovered that they all had a marking of an eye with a diagonal line through it in a square but after a few moments it vanished. There is no substance i know of that can do that, neither does anyone on the research team, if you find something please let me know immediately.
